DustLess™ Organic Fluid

Product Description

DustLess organic fluid is typically used in high traffic or heavy traffic areas as a solution for extreme dust. It soaks into the individual soil/dust particles making them too heavy to move thus eliminating dust. It does not form a crust and because it never evaporates it lasts for a very long time.

Typically 6 - 12 months of dust control with one application can be expected if applied at a rate appropriate for the conditions and anticipated traffic. As long as the treated soil is still in place it can be done at substantially reduced rates, should retreatment become desirable.

Higher application rates may be desirable if dust has high clay content or if depth of loose dust exceeds 1/4 - 1/3 inch on top of the compacted base. Higher application rates may also be warranted when high shear on the compacted base is an issue such as those areas where traffic is braking, accelerating, turning sharply, etc.

Dustless should never be mixed with water, however, it may be applied with any equipment capable of applying water. DustLess is very stable, will not freeze and has unlimited storage life.

To add to the lifespan of a dirt road treated with Dustless, DirtGlue polymer can be used for soft shoulder stabilization to minimize dust from the untreated areas immediately adjacent to the treated roadway.

Exclusive DirtGlue® Distributor for AK, WA State & Oregon
Additional Territories: ID, MT, & ND
