

Introduction to PotHoleGlue

PotHoleGlue is an environmentally friendly catalyzing product that is used to bond recycled asphalt or asphalt grindings together to form a pothole patch or repair that is stronger than the original asphalt. It has no VOCs and uses no petroleum products. Unlike other pothole repair systems, the bond at the seam between the patch and the old asphalt at the edge of the hole is very durable using this system. The PotHoleGlue repair patches easily outlast the surrounding asphalt.

The bonding capabilities of PotHoleGlue are so good that aggregate, even many insitu soils can be substituted for recycled asphalt when and where necessary or beneficial.

In order to be totally environmentally friendly it is necessary to use water to set off the catalytic reaction of PotHoleGlue. This creates one limitation, PotHoleGlue must be used when the temps are at or above freezing and will remain so for at least a few hours to permit full cure.

Of high value is the fact that when mixed exactly according to the directions and compacted thoroughly, a repair patch made with PotHoleGlue can be driven upon immediately.

PotHoleGlue is delivered in 55 pound plastic bags, 42 bags to the pallet. One bag will repair 50 sq ft at 1" of thickness. A repair done with PotHoleGlue is only done once because it outlasts the surrounding asphalt thus being very cost effective in the long run.

Exclusive DirtGlue® Distributor for AK, WA State, and Oregon
Phone: (907) 562-5755 ~ Toll Free: 1 (800) 490.5320
Washington State Sales: 206.774.8777
Additional Territories: ID, MT, & ND
