

FILTERPAVE®

Certified Contractor

John Donahue - Emerald Site Services, Frankfort, Illinois

John Donahue, President, Emerald Site Services, is an early trailblazer in a growing network of Certified Contractors trained and equipped to install the FilterPave porous pavement system. Its continuing business growth has seen a healthy boost with the integration of this eco-friendly product. Emerald is a perfect example of how contractors can make positive, proactive changes to increase sales with pavement solutions that are better for the environment.

POURS LIKE CONCRETE / FLEXES LIKE ASPHALT.

FilterPave pavement was a perfect fit for this environmental contractor experienced with concrete installation.

- Forms and pours like concrete and uses the same tools so little learning curve is required.
- The lightness of material is easy to work with and causes less stress on workers.
- Set up time is quicker than concrete so requires less monitoring and finish time.
- Stronger than asphalt, more flexible than concrete.

IMPROVING ECOSYSTEM MANAGEMENT.

When John speaks, people listen. For the last 10 years, Emerald has been designing and constructing low impact alternatives to traditional stormwater control systems such as bio swales, rain gardens and now permeable paving. The innovative use of green technologies to better manage stormwater runoff and enhance water quality is leading more developers and communities to seek Emerald's help in meeting increasingly stringent regulatory requirements at lower costs.

IDENTIFYING WITH GREEN. With recycled material content close to 96%, the benefits of a Filterpave pavement is easy to explain. Being able to use crushed glass aggregate from beer bottles and other recycled glass and create an environmentally-friendly product is very cool. The value of green does equate to creating desirable aesthetics and long-term savings for your customers. And, being a green contractor will draw attention to your company. Just ask John.
